## 1980 Mathematical Subject Classification

The 1980 Mathematics Subject Classification is a modest revision of the AMS (MOS) Subject Classification Scheme (1970). The revision was carried out jointly by Mathematical Reviews and Zentralblatt für Mathematik/Mathematics Abstracts. Mathematical Reviews will begin to use it in the first 1979 issue of CMP and in the January 1980 issue of MR. The new classification maintains the general structure of, and can be used in the same way as, the earlier one. The major changes in the classification system are summarized below. It is strongly recommended that anyone using this system for any reason read the instructions for its use and peruse the whole system.

The sections 02 and 50 have been completely rewritten and are now labeled “03 Logic and foundations” and “51 Geometry”, respectively. The following major fields were each rearranged (and in some cases expanded) and divided into several letter sections:

|  |  |
|--|--|
| 06 Order, lattices, ordered algebraic structures | 39 Finite differences and functional equations |
| 08 General mathematical systems                  | 42 Fourier analysis                            |
| 26 Real functions                                | 68 Computer science (including automata)       |
| 28 Measure and integration                       | 81 Quantum mechanics                           |
| 30 Functions of a complex variable               | 94 Information and communication, circuits     |

In many fields, the contents of the letter sections have been considerably expanded and/or rewritten. In particular, this is the case in the following sections: 10 Number theory; 12 Algebraic number theory, field theory and polynomials; 14 Algebraic geometry; 32 Several complex variables and analytic spaces; 58 Global analysis, analysis on manifolds. Section 18H has been deleted, and “Cohomology of X” is now found in the appropriate field for X. The contents of the old “20E Infinite groups” and “20F General groups, finite or infinite” were reshuffled and rewritten; the new section headings are “20E Structure and classification of infinite or finite groups” and “20F Special aspects of infinite or finite groups”. Section 34J has been deleted; in its place one should use section “34K Functional-differential and differential-difference equations, with or without deviating (or retarded) arguments”. There has been some reshuffling of the contents of 46L and 47D; 46L now contains only  $C^*$ - and von Neumann algebras and their applications, while general operator algebras and related topics are in section “47D Algebraic systems of linear operators”. The items in “49A Existence theory for optimal solutions” and “49B Necessary conditions and sufficient conditions for optimality” have been re-numbered so that the fine classifications are parallel now. The letter sections in “55 Algebraic topology” and “57 Manifolds and cell complexes” were re-ordered and the old 55A moved to 57; to avoid confusion between the old and the new classification, each of 55 and 57 now begins with a letter section M: 55C becomes 55M, 55B becomes 55N, 55A becomes 55M, 57A becomes 57N, and the remaining sections in 55 and 57 follow in the previous order.

Automata have been moved from Section 94 to Section 68. Any paper or book with its primary classification in (i.e., printed in) a physics section (70 through 86) must be assigned a cross-reference to at least one mathematics section (00 through 65). Papers in physics which are difficult to classify mathematically may be given the cross-reference 00A89. The section “69.00 General applied mathematics” (used in MR through 1979) has been moved to 00A69.

### Instructions for using the 1980 Mathematics Subject Classification

These instructions apply uniformly to all fields listed. The main purpose of the classification is to help all readers to find the items of present or potential interest to them as readily as possible—in MR, in Zbl, or anywhere else where this classification system is used. The review of a paper or book should be printed in the section where it will receive the broadest attention from all readers possibly interested in it—these include both people working in that area and people who are familiar with that area and apply its results and methods elsewhere (inside or outside of mathematics). It will be extremely useful for both readers and classifiers to familiarize themselves with the entire classification system and thus to become aware of all the classifications of possible interest to them.

Every paper or book reviewed in MR receives precisely one “primary” classification number; it is simply the number of the section in which the review of the item will be printed. This section should be the one that covers the principal contribution. When a paper contains several principal contributions in different areas, the primary classification should cover the “most important” among them. A paper or book may receive one or several “secondary” classification numbers (or “cross-references”), to cover any remaining principal contributions, ancillary results, motivation or origin of the problems discussed, intended or potential field of application, or other significant aspects worthy of notice.

The “primary” principal contribution should be the one including the most important part of the work actually done in the paper. For example, a paper whose main overall content is the solution of a problem in graph theory, which arose in computer science and whose solution is (perhaps) at present only of interest to computer scientists, should receive its primary classification in 05C and a cross-reference in 68; conversely, papers whose overall content lies mainly in computer science will receive a primary classification in 68, even if they make heavy use of graph theory and prove several new graph theoretic results along the way.

Any paper or book with its primary classification in (i.e., printed in) a physics section (70 through 86) must be assigned a cross-reference to at least one mathematics section (00 through 65). Papers in physics for which no other mathematical classification is suitable may be given the cross-reference 00A89.

There are two types of cross-references given after many classifications in the list. The first type is of the form “[For A, see X]”; if this appears in section Y, it means that for contributions described by A one should usually assign the classification X, not Y. The other type of cross-reference merely points out related classifications; it is of the form “[See also . . .]”, “[See mainly . . .]”, etc., and the classifications listed in the brackets may, but need not, be added to the classification of a paper, or they may be used in place of the classification where the cross-reference is given. The classifier will have to judge which classification is the most appropriate for the paper at hand.

#6867: Vidossich, Giovanni

The following paragraph should be added to the review:

"The results do indeed imply the indicated theorem of H. H. Corson and J. Lindenstrauss. The author shows that the function spaces are Lindelöf even in some stronger topologies, which in the separable case include the uniform topology. Thus the author has replaced the separable metric range with any  $\mathfrak{K}_0$ -space, the locally compact metric domain with a locally separable pseudometric space, and the topology with various stronger ones. The author's second theorem shows that 'locally separable' can be omitted if the topology of pointwise convergence is used".

## Volume 45

#645: Gera, Milan

On the third line of the title replace the first sign of equality by a plus sign.

#646: Gera, Milan

We also note the similarity of the syntax and the notation of this article and an earlier article of the author [Proc. Cambridge Philos. Sci. 64 (1968), 413-416; MR 36 #5403].

#9294: Hagopian, Charles L.

Replace the second sentence of the first paragraph by "The author cites a counterexample to show that this cannot be extended to nonlocally connected continua."

At the end of line 13, insert "A point  $r$  in  $M - \{p, q\}$  is said to cut  $p$  from  $q$  in  $M$  if each subcontinuum that contains  $\{p, q\}$  also contains  $r$ ".

In line 18 replace the word "separates" by the word "cuts".

## Volume 50

#4717: Sanerib, Richard

The reviewer wishes to delete his remarks at the end of his review.

He asserts that these remarks are entirely unsubstantiated and have no bearing on the real contents of the paper. He regrets his carelessness and hopes that it has not cast aspersions on the interesting main results of the paper.

#12999: Ferrero, M. A.

The following erratum should be added to the review:

"Over a field of characteristic 2, the quadratic form  $x_1^2 + x_2^2 + \dots + x_m^2 = (x_1 + x_2 + \dots + x_m)^2$  is degenerate for  $m > 1$ . Therefore, the objection raised by the reviewer to Lemma 1 of this paper is invalid. A corrected statement of this lemma has been published by the author [MR 53 #8106]".

In the third line from the end the sentence should read "The close connection between matroids and geometric lattices is mentioned but should have been discussed more fully, in the reviewer's opinion".

#11738: Shephard, G. C.

The following review supplements the existing review:

"This paper is a contribution to the theoretical aspects of making models of convex 3-polytopes from planar nets which are convex polygons. Although very few polytopes have a convex net, the author shows that very many combinatorial types of polytopes can be achieved including all pyramids, all prisms and all polytopes with at most six vertices or faces. He exhibits a type of polytope with 17 vertices which cannot be achieved, and gives conjectures and problems".

#12668: Mangiarotti, Luigi

Replace the review by the following:

The author studies the stationary neutron transport Boltzmann equation as applied to a three-dimensional system  $D$ , made by a rectangular multiplying core surrounded by a finite reflector, in both the Lebesgue space  $L_2(D)$  and the space  $C(D)$ .

## #3341: Ramm, A. G.

In line three replace "with a finite number of singularities" by "of finite order of singularity".

The following is an addendum to the published review:

Hien Q. Nguyen [Proceedings of the Montana Academy of Science, vol. 37 (1977), pp. 101-102] has produced a counterexample to the author's characterization of the covering relation for  $\mathcal{L}(L)$  in terms of a condition involving the hyperplane closure  $c(B)$  of a basis. The necessity of the condition as proved by Las Vergnas is valid, but the example shows that the condition is not sufficient as not every basis will produce a covering pair of erections. Nguyen proposed that  $c(B)$  be replaced in the theorem by the set  $T$ , a minimal (for inclusion) hyperplane-closed spanning set of  $N$ .

## #6416: Gheorghe, Florin-Christian; Obreja, George
